Summary

Frontend developer with 5+ years of experience building and redesigning complex, high-load web applications in TypeScript and Next.js. As a member of a small team on a large-scale project, I developed a thorough understanding of both back office and front office, touching nearly every part of the system along the way. Among my key contributions was a solution I proposed on a B2B product, approved by our main client, that led to a major improvement to the key workflow managers use most.

Experience

RGB code | Israel, Tel Aviv-Yafo (Remote)

October 2022 - September 2026

Frontend Developer

Product: [Mevalim](#) one of Israel's leading ticket-booking platforms, with **1M+ monthly visits**.

Stack: Next.js, TypeScript, Zustand, Tailwind CSS, Radix UI, React Query, Context API, React Hook Form

- One of just two frontend developers in a team of five, responsible for the entire frontend layer of a large-scale, live product.
- Shipped features and fixes for the back office, a B2B tool used daily by internal managers and by partner companies running their own events on the platform.
- Identified major usability issues in the most heavily used part of the back office and proposed a redesigned structure and layout that was approved and shipped to production, earning strong positive feedback from managers.
- Engineered the Event History view to handle large volumes of typed data, using scroll-based prefetching to keep navigation fast and avoid loading delays for managers.
- Designed the state architecture for the coupon manager's three connected tabs using Zustand, ensuring changes in one tab stayed instantly consistent with the others without relying on standard form state.
- Delivered a pixel-perfect front office redesign from Figma mockups across the full user flow, from login to the thank you page, supporting both RTL and LTR layouts on a fully responsive interface.
- Reduced the share of tasks sent back for **rework to under 20%** over time, through more careful upfront analysis and closer alignment with QA and requirements.
- Adopted Cursor and Codex to speed up feature development and debugging, paired with CodeRabbit for automated review, always verifying generated code myself before it went live.
- Handled infrastructure work beyond core frontend responsibilities when needed, migrating builds to Blacksmith after tracing recurring deployment slowdowns to server resource contention.

Freelance & 4EC labs | UK, London (Remote)

September 2021- September 2022

Web developer

- Developed responsive, pixel-accurate multi-page websites and landing pages from Figma designs, working directly with clients as a freelancer and with clients and designers through 4EC Labs.
- Optimized a [photography portfolio site](#) for performance, using WebP formatting and responsive image sizing to bring grid and full-screen preview loading **under one second**.
- Handled full project delivery independently — integrating third-party APIs and contact forms, configuring Google Analytics, and deploying through Vercel.

Education

Moscow Institute of Physics and Technology, BSc Computer Science

2015-2019

42 Paris | (Peer to peer based international IT program)

2020-2021

Skills

Frontend: React, Next.js, TypeScript, JavaScript, Tailwind CSS, HTML5, CSS3

State & Data: Zustand, Redux, React Query, React Hook Form

Linguistic: English (Advanced), Russian (Fluent)
